SUNS WITH PLANETS

In the Middle Ages it was considered one of the greatest sins to maintain that there were other worlds like our earth in space. The nether world and the upper world were meant to exist, but everything beyond that was forbidden and persecuted. Now, centuries after the death of Bruno, who announced that there are uncountable suns with planets in space, most of us still stand, in all that matters, in the footsteps of medieval people. Many believe that the Earth is the only point in the universe that counts, and when they hear the word "planet", they exclusively think of the planets in our solar system, which are meant to be uninhabitable. But when they hear the word "star", they think of some remote, indifferent tiny dots, not realizing that every dot implies one vast world of a sun with planets, planets that are the abode of countless living beings. It is important to notice that on a planet like ours, where ignorance triumphs, the astronomers themselves still show the incredible cowardice of not mentioning, in textbooks and surveys, the man on whose discoveries their science rests. They may mention Copernicus, Kepler, Galileo, and even Tycho - but Bruno, almost none of them. The name of the man who discovered the universe is a taboo in many astronomical circles. In this way mankind is kept in ignorance about the main theme of cosmology, which is the existence of solar systems in space.

In the 19-30es, they invented an elaborate "collision theory" about the origin of our solar system (that some unknown star had passed the sun at a great speed) and the most serious consequence of that theory was that there were no other solar systems in the universe. Everything in the circumstances of the creation of the planets had to have been so unique that it could not possibly have occurred twice in the history of all galaxies that could be seen. So they wanted it and so they constructed the theory they wanted. On this very weak thread it was argued, that probably all the suns of the Galaxy, except one, were without planets, and that instead of the

"living universe" we had a dead one. On the same premises, many astronomers of that period based their attitude, and when it was shown, a few years later, by C. v. Weiszäcker and others, that even the calculations in favour of the "collision theory" were wrong from the beginning, this seemed not sufficient to root out the error that had crept in. "Where are your proofs for the existence of planets with other suns" cried a youngster of the new generation at me as late as in 1965. It would have been of no help for me to point out that he was building on the "collision theory", which had been defeated many years ago - he would none the less have insisted: "Where are your proofs?" Actually new proofs were already there, but since I knew that the man was aware of them, and yet he was against the existence of other solar systems, I thought it was more wise to retract into silence and wait for better times. I knew that the gravitational proofs for the existence of planets with some near by suns were gaining more and more weight, and sooner or later this knowledge would build up an opinion that would defeat those remnants of barbarism. And in the course of the years that passed, I was not disappointed. Today it will not be easy for anybody to insist upon the non-existence of planets with other suns, against the scientific opinion, now based upon the gravitational proofs.

COMMON NATURE OF SOME PSYCHIC PHENOMENA

Telepathy is somewhat like television. Though television is not of the psychic nature its pattern has something in common with telepathy. Both are SENSING from the DISTANCE. We can provoke a TP sensing as well as it may happen involuntarily. But always at least two brains are indispensable: that of the inductor of the mental picture and that of the receiver of the induced mental picture. Just as both TV set and TV broadcast station are necessary for TV to take place. We can provoke a TP phenomenon if both the receiver and the transmitter (inductor) have proper TP abilities. Therefore one shouldn't expect a radio set to receive the TV broadcast. Good human relations (friendly, familiar etc.) between SENSITIVE persons highly facilitate the TP phenomenon to take place. Such very common phenomena take place often enough and they are usually called "guessing somebody's thoughts".

TP experiments in some countries (Italy, dr. Piero Cassoli) give much better results than TV experiments carried out there. It is only a pity that we still do not realize the importance of the first.

TP sensing can be considered as a way of communication between two brains. On the other hand the majority of people still don't realize that our dreams (some of our dreams) are yet another way of communication with other brains. Perhaps only some of the readers of the present article realize well enough that at the very time when they are reading these lines the mental pictures to be actually found in their brains and representing the exact state of their minds are being involuntarily induced into other brains and cause SOMETHING LIKE A TV MENTAL PICTURE to arise in the brains of some sleeping persons. And a sleeping person starts to dream. The reception of an induced

"TV mental transmission" is going on in the brain of a dreaming person. When such a person will awake he may still remember what kind of dream he has just had. He would see in his dream somebody reading an article, sitting at the table etc. Look at your nearest surroundings now when you are reading these lines and you will be able to realize that what you can see with your own eyes right now, somebody else may happen to see IN HIS DREAM as if with his own eyes. This TV mental transmission takes place in "both directions". The TV mental pictures' receiver (a sleeping person) can function equally well as the TV mental pictures' transmitter (an awoken person).

Just as a TV transmission can be distorted' due to the external unfavorable conditions so the TV mental pictures' reception (or transmission) can be influenced and changed. The vague reminiscences of the everyday life events may add to the original, genuine TV mental pictures received. The signals from afar become somehow distorted. But in favorable conditions the dreamt about scenes are actual life of other persons. There isn't anything "unusual" in it. The very word "unusual" seems to be quite a useless one. We have invented such a word because of our eternal ignorance and imperfection. Our insufficient imagination ability makes for us impossible to get an understanding of a phenomenon to which we are not "accustomed" enough.

Astronomy tells us about the unlimited Universe and about light-years-distances between solar systems. Mathematics gives us

the theoretic confirmation of the possibility of EVERYTHING to happen in an UNLIMITED system as the Universe is. But we always lack courage to get familiar with the idea. We stick to our "I" and to our "WE". There isn't anything else but "OUR planet" and "OUR sun" and "OUR solar system and "OUR galaxy".

We have invented hundreds of religions and hundreds of political systems and thousands of superfluous and misleading ideas only. And all the time this common lack of imagination ability remains the main obstacle on the right way towards the REALIZING of the objective Universe.

Without the participation of our will we are constantly sending the bioradiative signals into space, into the Universe. The mental pictures from our brains are being received by (sleeping) people (beings) on other planets of other solar systems. T H E Y are also receiving the "signals from afar". T H E Y have also an inlook into our life and T H E Y also look at us as if with THEIR own eyes. And again, some of them do realize this fact and some others do not.

This is a constant two directions traffic between all the TV mental stations of the Universe. This is the involuntary bioradiative communication. When we get awake from the sleep we stop dreaming. And as long as we do not fall asleep again so long there is no more possibility for the dream contact (for the reception of the TV mental pictures from our dream-giver(s)).

But when being awake our brain is able to receive other kinds of TV an TP mental pictures transmissions from other awake(present minded) brains. This way our consciousness may be strongly influenced by other more powerful brains than the ours. We act as if we were in a trance. We do not feel our own personality but first of all that of our sensation-giver. People with a weak personality can be relatively easily tele-controlled by more powerful brains. Usually with ill intentions as the contents of the induced (transmitted) signals. It is due to our imperfect senses that we still are unable to receive the signals from afar. But sometimes our not perfect brain gets modified and the reception of some special signals is easy enough.

Leonardo da Vinci was considered in his lifetime to be "out of mind". Now nobody dares to say so. We admit that he was man of genius. We should even correct this statement. Due to

genetic reasons his brain was far more sensitive than all the other brains of his contemporaries. In consequence he was more apt to receive the signals from afar.

Narcotics act as special filters set on our brains. We see the pictures sent from afar. Pictures which are not received by the others.

Years ago it was impossible to receive an electromagnetic transmission from afar. Of course it wasn't since yesterday that the signals from afar were being sent out from various sources in the Universe. It was only since yesterday that we were able to receive them (radioastronomy). The technical progress makes possible and facilitates the reception of many a kind of transmissions from afar. But when we consider the "modern" apparatus for the reception of the signals from afar we usually forget that our own brains which constructed these apparatus are also a kind of receivers. Far more delicate and adapted to register the most subtle bioradiative signals.

Such words as: friendship, love, hate, etc. are unprecise descriptions of the continuous mental contact between human brains. We all communicate with the others and the nature of this communication is the bioradiative one.

A short-sighted person is unable to see what the others see. Daltonists see otherwise than we do. But everyone of us sees a reality. There are always electromagnetic signals racing through space as well as bioradiative ones. But only some brains are able to "tune to" those bioradiative signals and interpret them in the correct way. Some brains are able to induce friendly or hostile feelings and others - only to a certain extent. Though the general pattern is always the same we are not all alike.

Maybe from another point of view we are quite alike... And that is why we dislike the person who is not "like all the others".

That is why the N E W ideas are strongly opposed to. That was why Giordano Bruno was burnt alive. That is why you are so sceptic.

It is definitely not enough to state simply that "we are not alone in the Universe". (Though luckily enough such voices can be heard more often lately.)

One should add to this statement soon: "and we are in touch with

each other too'. We have always been so since we exist but it is only now thanks to the discoveries of Pjeturss that we realize this constant involuntary bioradiative contact. Thanks to the technical progress we know how to receive and analyse the signals from pulsars and quasars. If these signals from afar shock us with their regularity and power and if they make us think about the BRAINS which direct them, so this way we have yet another proof in favour of our NOT BEING ALONE.

Jerzy Wielunski
Lublin

SIRIUS CONTACTS

The splendid star Sirius, is called a double sun, although one of the components is much smaller and fainter than the main sun. There are two possibilities for a life-bearing planet in the system: that of one revolving around the larger sun, or of one revolving around the smaller sun, which then would be in a position similar to the moons of Jupiter, and thrive by light and warmth from the larger sun too. From the astronomical point of view, it would then be exceedingly interesting to get proper observations transferred from there.

In the 17th century, Huygens tried to measure the distance of Sirius. It is known that Huygens propagated the idea of very similar mankinds in space. In other words: he was a true philosopher, and maybe he had some contact.

In 1752 Voltaire wrote the story of Micromegas, a great and small man from a planet with Sirius, who was said to have "landed" on the shores of the Baltic on July 5th, 1737. We understand that there may have been an attempt at materialisation, which was misunderstood and therefore prevented by the inhabitants. The remarkable fact that the story implied that Mars had two moons, at the proportionate distances of 3 and 5 Marsradii, supports our view that there is something genuine behind that story.

In 1956 the present writer had an astronomical dream, which indicated a galactic position of the source somewhat close to Sirius's.

In 1966, in Iceland, a mediumistic contact with Sirius was obtained, and a lot of interesting information came through. There is a Thinker, a scientist and a leader in the things that matter,

who has discovered the samband (contact, connection, communication) of life in the universe, but for this discovery the stupid set ignored him and tried to declare him a madman. In spite of this, there are many on the Sirius-planet who admire his work and the movement based on it may become successful.

In 1970 Knut Aasheim, in the Norwegian magazine "Fakta?" (Nr. 3, 1970), wrote a very remarkable article (Tachyoner og Tankebølger), where he put forth the idea of scientific "colleagues" on different planets. There are thinkers, on a number of planets who are concerned with similar problems, and some of them already know the solution, some not. Those who know, send by their brain activity, telepathic messages into space, and a colleague on another planet receives them. Knut Aasheim has by this article taken a large step towards progressive thought.

In 1972, a Norwegian séance experimenter got a contact with a personality on Sirius, perhaps with the same thinker who was active in the Iceland contacts. Further contacts are expected.

The difference is that all the contacts here on earth have been in the passive, receptive way. For further progress conscious initiative from the Earths side is needed.

A "Hit" in Parapsychology: "It should be recalled that some parapsychologists reject the notion that ESP involves a transfer of information. To them, a "psi-field" operates in which memory traces in the S are stimulated by a mutual A-S resonance; if this is true the entire notion of an active-passive-interaction is, perhaps, simplistic and irrelevant". In these words, St. Krippner in the Journal of A.S.P.R. is referring to W.G. Roll's: "ESP and Memory", Int. Journal of Neuropsychiatry 1966, p. 505-521.

It is a pity that such earnest thinkers do not draw the advantage they could, from H. Pjeturss's philosophy, which casts so much light on almost all their present problems.

Where is Ours?

"Jamais peut un savant ne affirmer qu'il est infallible. Il peut demander seulement ceci: qu'on lui montre ou est son erreur."
Charles Richet - From: Quaderni di Parapsicologia, 1970.

News from Earth

1. The Pulsars are still disquieting technical scientists, by their their puzzling, incredibly regular or regularly interrupted rythms, which indicate intelligent control. The Cambridge Influentials, who hold a key position in the global suppression of opinion concerning the Pulsars, have recently dismissed Fred Hoyle, world famous astrophysicist and scientific writer, because they feared his insight into their secret.
2. The Quasars are still being intensely observed, and more and more evidence for the ultra-velocity of material transfer is being brought in. Fascinated by those irresistible wonders of the universe, the physicists wonder and wonder, but because of the absence of philosophy in their circles, they dare not think any further.
3. The Biodynamic Concentration Efforts are being initiated here and there, although very vaguely and loosely still. United mental effort is missing, to remove the worst dis eases from the face of the Earth, but nonetheless, some kind of:
4. Peace in the Indo-China lands, could be within the reach of an arm, if there was somebody to stretch it out. Two persons in America and two in Asia, who had acquired an understanding of the workings of biodynamics, would suffice to prevent the undoing of the present opportunity.
5. Where Will They Begin Next? is the cry that ascends to the stars from the tortured Earth now. For we know from experience that every time the play is halted in one part of the planet, it is being ignited and increased elsewhere. In accordance with a biodynamic law, on a planet like ours, Initiative is placed at the hands of killmasters, the instruments of the evil influence. Since the ignorance about these matters is almost complete, such influences usually have an easy play.
